## *Analysis details for customer:*

- **Problems Statements:**

1) What kind of customers are purchasing more based on region, and what does the business need to understand about their purchasing patterns?
2) What is the highest type of purchase?
3) What is the customer satisfaction score based on NPS (Net Promoter Score) metrics for purchases made so far?
4) Which products have the highest purchase frequency compared to others?

- **Finding:**

1) **East & West region has higher purchases and value of those purchases are medium.**
2) **Medium Valued purchases are highest contributor in overall purchases following that low value purchases.**
3) **NPS so far is -93% which is very low.**
4) **Electronics, Clothing, Books, Food has highest purchase frequency compared to others.**

## *Proposed Solution:*

- We must analyse the sentiment of customer to identify the cause of such low NPS scores.
- We must propose offers on electronics, Clothing, Books, Food which has higher frequency for maximum profits
- We must re-evaluate the process of assisting customer or whom so ever is interacting with customer for better understanding on ground level
- In East and West region, we have good rate of purchases so we must evaluate to understand what drives purchase in these areas and do same in other regions with better customer experience
- Frequent customer has rated 5 which have major contribution so we must focus on this customer for our retention process
- Customer are preferring to spend medium value (between 8000-15000) in their purchases. So, any products in this range is high likely to be sold.
- Loyalty campaign needs to evaluated as our gold and silver customers have low purchase amount and huge contribution in Detractors
  *(There is almost 0.00% detractors from gold status)*

---

***Thanks & Regards,***
